

1 Design Matrix to Student-t Model

1.1 Input and Assumption Nodes

Input node: `var.X`. Result node: `model.student_t_noise`.

1.2 Derivation

The Student-t observation model uses each row $x_i^\top$ of X to form the linear location $x_i^\top \beta$.

1.3 Result

The design matrix is a required input to the Student-t observation model.
