

1 Beta to Gaussian Prior

1.1 Input and Assumption Nodes

Input node: `param.beta`. Result node: `prior.gaussian.beta`.

1.2 Derivation

The Gaussian prior is a distributional assumption on the existing coefficient vector:

$$\beta \sim \mathcal{N}(0, \tau^2 I_d).$$

1.3 Result

The coefficient vector β is the random variable governed by the Gaussian prior assumption.
