

1 Noise Vector to Gaussian Model

1.1 Input and Assumption Nodes

Input node: `var.epsilon`. Result node: `model.gaussian_observation`.

1.2 Derivation

The Gaussian observation model uses the noise vector ϵ in

$$y = X\beta + \epsilon, \quad \epsilon \sim \mathcal{N}(0, \sigma^2 I_n).$$

1.3 Result

The noise vector is a required object for the Gaussian observation model.
