

1 Degrees of Freedom to Student-t Model

1.1 Input and Assumption Nodes

Input node: `param.nu`. Result node: `model.student_t_noise`.

1.2 Derivation

The Student-t observation model uses the positive degrees of freedom ν in

$$\epsilon_i \sim t_\nu(0, \sigma).$$

1.3 Result

The parameter ν controls the tail heaviness of the Student-t noise distribution.
