

1 Noise Scale to Gaussian Model

1.1 Input and Assumption Nodes

Input node: `param.sigma`. Result node: `model.gaussian_observation`.

1.2 Derivation

The Gaussian observation model uses the positive scale σ to set the covariance of the noise:

$$\epsilon \sim \mathcal{N}(0, \sigma^2 I_n).$$

1.3 Result

The scale parameter σ is required to specify the Gaussian noise distribution.
