

1 Response Vector to Student-t Model

1.1 Input and Assumption Nodes

Input node: `var.y`. Result node: `model.student_t_noise`.

1.2 Derivation

The Student-t observation model specifies the conditional distribution of the existing response vector:

$$y_i \mid X, \beta, \sigma, \nu \sim t_\nu(x_i^\top \beta, \sigma).$$

1.3 Result

The response vector is the observed object whose conditional distribution is specified by the Student-t model.
