

1 MAP from Objective

1.1 Input and Assumption Nodes

Input node: `objective.gaussian_negative_log_posterior`.

1.2 Derivation

The MAP estimator is the minimizer of the negative log posterior objective:

$$\hat{\beta}_{MAP} = \arg \min_{\beta} \frac{1}{2\sigma^2} \|y - X\beta\|_2^2 + \frac{1}{2\tau^2} \|\beta\|_2^2.$$

1.3 Result

The result node is `estimator.beta_map`.
