

1 Student-t Change Experiment Derivation

1.1 Input and Assumption Nodes

Input node: `approx.student_t_map`.

1.2 Derivation

The experiment compares coefficient recovery under Gaussian MAP and Student-t MAP when data are generated with heavy-tailed residuals:

$$\|\hat{\beta}_G - \beta_0\|_2 \quad \text{versus} \quad \|\hat{\beta}_t - \beta_0\|_2.$$

1.3 Result

The experiment will generate `results/student_t_change_summary.json` and `results/student_t_change_error.png`.
